"Primary structure and properties of the cathepsin G/chymotrypsin
inhibitor from the larval hemolymph of Apis mellifera.";
Eur. J. Biochem. 262:680-680-687(1999).
-!- FUNCTION: Chymotrypsin and cathepsin G inhibitor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Contains 1 Til. (Trypsin inhibitory-like) domain.

THE MUCIN-LIKE DOMAIN MIGHT INHIBIT INAPPROPRIATE TRAPPING OF
SPERMATOCA OR PROMOTING ADHESION TO THE OYIDUCTAL ISTHMUS.
-!- DOMAIN: The WWFD domain 2 may mediate covalent oligomerization (by
similarity to human intestinal mucin MUC2).
-!- SIMILARITY: Contains 3 MAM domains.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- CAUTION: Ref. 2 sequence differs from that shown due to
transposition of a number of exons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -I - FUNCTION: BINDS IN A SPECIES-SPECIFIC MANNER TO THE ZONA PELLUCIDA OF THE EGG. -i- SUBGNIT: PROBABLY FORMS COVALENT OLIGOMERS.
-i- SUBGRILLULAR LOCATION: TYPE I MEMBRANE PROTEIN, EXCLUSIVELY ON THE APICAL REGION OF THE SPERM HEAD.
-i- TISSUE SPECIFICITY: IN TESTIS; PRIMARILY IN HAPLOID SPERMATIDS.
-i- DOMAIN: THE WAM DOMAINS PROBABLY MEDIATES SPERM ADHESION TO THE ZONA PELLUCIDA.
-i- DOMAIN: DURING SPERM MIGRATION THROUGH THE REPRODUCTIVE TRACTS, THE WUCIN-LIKE DOMAIN MIGHT INHIBIT IMAPPROPRIATE TRAPPING OF SPERMATOZOA OR PROMOTING ADHESION TO THE OUTCTAL ISTHMUS.
-i- DOMAIN: THE VWFD DOMAIN 2 MAY MEDIATE COVALENT OLIGOMERIZATION (BY SIMILARITY TO HUMAN INTESTINAL MUCIN MUC2).
-i- SIMILARITY: CONTAINS 25 VMFD domains.
-i- SIMILARITY: CONTAINS 1 EGF-like domain.

Low-density lipoprotein receptor-related protein precursor (LRP).
LRP-1 OR F29D11.1.
                                                                                                                                                                                                                                                                                                                                    Wilkinson J.;
Submitted (NAX-1996) to the EMBL/GenBank/DDBJ databases.
Submitted (NAX-1996) to the EMBL/GenBank/DDBJ databases.
SUBMITTED (NAX ACT AS A RECEPTOR FOR THE EMDOCYTOSIS OF
EXTRACELLULAR LIGANDS SUCH AS CHYLOMICRON REMNANTS, PROTEASE-
INHIBITOR COMPLEXES AND VITELLOGENIN.
--- SUBCELLULAR LOCATION: Type I membrane protein.
--- SIMILARITY: Contains 35 LDL-receptor class A domains.
--- SIMILARITY: Contains 17 EGF-like domains.
                                             Score 92.5; DB 1; Length 63;

The receptor for yolk lipporotein deposition in the chicken oocyte.";

J. Biol. Chem. 266:18761-18770(1991).

-! FUNCTION: Binds YLDL and transports it into cells by endocytosis.

-! FUNCTION: Binds VLDL and transports it into cells by endocytosis.

In order to be internalized, the receptor-ligand complexes must first cluster into clathrin-coated pits. Binding to Reelin induces tyrosine phosphorylation of Dabl and modulation of Tau

In order to be internalized, the receptor-ligand complexes must thist clueter into clathrin-coated pits. Blinding to Reelin induces tyrosine phosphorylation of Dabi and modulation of Tau phosphorylation (By similarity).

SUBUNIT: Binds to the extracellular matrix protein Reelin (By similarity).

SUBCLILULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R GO; GO: 0005041; F:low-density lipoprotein receptor activity; TAS.

ISSUE SPECIFICITY: ABUNDANT IN HEART AND SKELETAL MUSCLE; ALSO OVARY AND KIDNEY; NOT IN LIVER.
SIMILARITY: Contains 8 LDL-receptor class A domains.
SIMILARITY: Contains 6 LDL-receptor class B domains.
SIMILARITY: Contains 3 EGF-like domains.

-I- FUNCTION: Binds VLDL and transports it into cells by endocytosis.

-I- FUNCTION: Binds VLDL and transports it into cells by endocytosis.

In order to be internalized, the receptor-ligand complexes must first cluster into clathrin-coated pits. Binding to Reelin induces tyrosine phosphorylation of Dabl and modulation of Tau
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BINDING TO REELIN.

--- SUBUNIT: Binds to the extracellular matrix protein Reelin.
--- SUBUNIT: Binds to the extracellular matrix protein.
--- TISSUE SPECIFICITY: Type I membrane protein.
--- TISSUE SPECIFICITY: ABUNDANT IN HEART AND MUSCIE; LESS IN KIDNEY,
--- SIMILARITY: CONTAINS 8 LDL-receptor class A domains.
--- SIMILARITY: Contains 6 LDL-receptor class B domains.
--- SIMILARITY: Contains 3 EGF-like domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 62,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A Geneseq 19Jun03:*

                                                                                                                       protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/Fr. The specification contains a selective inhibitory activity. The method comparison for factor VIIa/Fr selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the activated protein in an ex vivo proturomain time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the act assay, with respect to a baseline clotting value for cach assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/FF inhibitory activity. The method is useful for determining if a protein has factor VIIa/FF inhibitory

                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the Ancyclostoma caninum nematode-extracted anticoagulant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated incravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

                                                                                                                                                                                                                                                                                                                                                                                                       They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm. Vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in prothrombin time assays when present at 10-50 nMol, and double the clotting time of human plasma in activated partial thrombin time assays at 10-100 nMol.
                                                                                                                                                                                                                                                             activity, isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosts and identification of NAP concn. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygyrus.
The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv., do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                             Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                              Proteins with anticoagulant and/or serine protease inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/TF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nematode extracted anticoagulant protein AcaNAPc2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 486; DB 17;

protein (NAP). The protein has activity as an anticoagulant and/or serine proteins inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF. The specification of the clear that time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin lime (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating concentration of clotting effected by the isolated protein in each of the T and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting time relative to a baseline clotting value, where card doubling of clotting time relative to a baseline clotting value, where calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8 KATMQCGENEKYDSCGSKECDKKCKYDGVEEEDDEEPNVPCLVRVCHQDCVCEEGFYRNK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                    The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protein inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting an isolated protein at least one domain isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the T and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and a calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIA/TF inhibitory activity. The method is useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is the Ancyclostoma caninum nematode-extracted anticoagulant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood colotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  67

The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification of escribes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the confidence of solated protein in an ex vivo prothrombin time (PI) assay and an ex vivo activated partial thromboplastin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay, and each of prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, where prolongation of clotting is calculated as fold clavation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least cone is indicative of factor VIIa/FF inhibitory activity. The method is useful for determining if a protein has factor VIIa/FF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 CGSNERYSDCGNDKQCERKCNEDDYEKGDE----ACRSHVCERPGACVCEDGFYRNKKG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The specification for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the cartivated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (STT) assay; calculating to prolongation of clotting effected by the isolated protein in each of the PT and appTr assay, which respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold alevation of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infaction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites.

The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolyic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP conon. levels in biological they can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may when present at 10-50 nMo1, and double the clotting time of human plasma in activated partial thrombin time assays when present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Laroche YR;

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TP complex in the presence of factor Xa or a catalytically inactive factor Xa deriv., do not specifically inhibit the activation of factor VIIa in the absence of TP and do not specifically inhibit prothrombinase. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     43.6%; Score 212; DB 17; Length 190; 50.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein (NAP). The protein has activity as an anticoagulant and/or serine proteins inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/Fr. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/Fr selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay, activated partial thromboplastin time (aPT) assay, activated partial thromboplastin time (aPT) assay, and are vivo prothrombin time (aPT) assay, where prolongation of clotting effected by the isolated protein in each of cach assay, where prolongation of clotting time relative to a baseline clotting value for each assay, where prolongation of clotting value, where a doubling of clotting time relative to a baseline clotting value, and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/Fr inhibitory activity. The method is useful for determining if a protein has factor VIIa/Fr inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            э

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a nematode extracted anticoagulant protein (MAP). The protein has activity as an anticoagulant and/or serine protein in the protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting an isolated by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay, and an ex vivo prothrompin captured partial thromboplastin time (aPT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a calculating a PT to aPTT prolongation ratio, where a ratio at least calculating as PT to aPTT prolongation ratio, where a ratio at least cone is indicative of factor VIIA/TF inhibitory activity. The method is useful for determining if a protein has factor VIIA/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening an isolated protein for Nematode-extracted Anticoagulant
Protein domains

protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification for factor VIIa/TF. The specification of the factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the activated protein in an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay, and each of cheting effected by the isolated protein in each of the PT and april assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, a calculating a protein that the method is useful for determining if a protein has factor VIIa/TF inhibitory activity. The method is
Screening an isolated protein for Nematode-extracted Anticoagulant Protein domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present sequence represents a nematode extracted anticoagulant
                                                                                                                                                                                                                                                                                          Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/TF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     41.6%; Score 202; DB 20; Length 86;

Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
